PROFESSIONAL SUMMARY

With over 2 years of experience in Python and its frameworks & libraries, I specialize in product development and data analysis. I excel in creating scalable solutions, optimizing performance, and leveraging data to drive strategic insights and decision-making.

EXPERIENCE

Python Developer

LogicRays Technologies 📍 Ahmedabad, India

📅 Jun 2023 - March 2025

TECHNICAL SKILLS

- **Languages/Scripting:** Python, JavaScript, HTML5, SQL, ReactJS (Basic).
- **Python Frameworks:** Django, Django REST Fast API, SQLAlchemy
- **Web Scraping & Automation:** Selenium, BeautifulSoup.
- **Architecture:** Monolithic & Microservices
- **Web Services:** REST API, RabbitMQ, WebSocket
- **Databases:** PostgreSQL, MySQL, SQLite, MongoDB, Redis
- **Tools:** GitHub, GitLab, Docker, Jira, Trello, Apache Airflow, Celery

PERSONAL SKILLS

- Strong leadership, problem-solving skills, and ability to work under pressure.
- Independent, yet effective team player with a proactive approach.
- Positive, goal-driven, and eager to learn new technologies.
- Dedicated, helpful, and committed to delivering quality work.

PROJECTS

TrackIT

📅 July 2024 – Feb 2025

- This project is focused on **web scraping** primarily aimed at fetching real-time product details from multiple Quick commerce platforms such as **Zepto, Blinkit, and Instamart**.
- The process starts with a CSV file containing a list of products, which is used as input.
- The script is triggered using **Apache Airflow** to automate the execution.
- The script then searches for the specified products on the above platforms and scrapes their current price and availability data (Based on particular pin code).
- Once the script completes execution, it generates an updated CSV file that contains the product details along with their availability and pricing at the time of execution.
- To handle IP blocking issues, **IP rotation** was implemented and Third-party proxy APIs were integrated to enhance scraping reliability.
- After successful execution, the resulting CSV file is automatically uploaded to an **S3 bucket**.
- A custom admin panel was built to manage and monitor the scrapped data.
- The backend was developed using **Fast API**, while the frontend was built with JavaScript and Tailwind CSS.
- The panel includes authentication and authorization features for secure access control.
- Additionally, a separate Dashboard & Analytics Service has been developed as a **microservice** to provide insights into product data and script execution performance. After each script execution, a message is published to the dashboard service via **RabbitMQ**, prompting it to read the newly uploaded files from AWS S3 and update the analytics in real time.
- The dashboard also includes a custom button to manually update the analytics, allowing users to refresh data on demand. Additionally, a scheduled job runs every hour to automatically update the analytics, ensuring real-time insights into product data and script execution performance.
- **Technology:** Python, Fast API, sqlalchemy, Pandas, Selenium, AWS (S3, EC2, RDS), RabbitMQ (Microservice), Celery, Redis, HTML, Tailwind CSS, JavaScript,

OneHeartMarket

📅 Dec 2023 – May 2024

- This project is similar to **LinkedIn**, but the major difference is that LinkedIn is for tech persons, whereas this project is for non-tech persons.
- OneHeartMarket has functionality like creating a user profile to register yourself and a business profile to register your business.
- Normal user profiles will be considered as job seekers, and the business profiles will be considered as recruiters.
- Job seekers can apply to posted jobs by business users, create CVs, save jobs and business profiles, and make posts, etc.
- Also, it has functionality like following, unfollowing, and blocking users, similar to Instagram.
- Additionally, it has functionality like LinkedIn posts to post feeds with likes and comments (1 level nested) (with the functionality to report).
- For business profiles, there are multiple sub-admins to handle features based on users' roles and permissions.
- Implemented strong authentication **JWT via DRF**. Also, for some payment parts, used the **Stripe** payment gateway.
- Integrated the notification system using **Firebase**.
- Implemented API test cases using **Pytest** to ensure reliability and correctness of all endpoints.
- This project also includes a **real-time chat** feature, enabling direct one-on-one communication between users. The chat system is built using **WebSockets**, ensuring seamless real-time messaging with message encryption and decryption.
- The project has also been containerized using Docker, enhancing its deployment and scalability capabilities.
- **Technology:** Django Rest framework, MySQL, MongoDB, Pytest, React, Docker, Firebase, Stripe, GitHub, Swagger

Billing System

📅 Aug 2023 – Nov 2023

- A system that's easy to use and keeps track of invoice of customers order. By adding a strong authentication system, including a **two-step verification** with options like Google Authenticator.
- Effectively managed **CRUD** operations of the customer, seller, category, and product info.
- Furthermore, the system streamlines the invoicing process by allowing sellers, registered as organizations, to generate PDF invoices with **QR codes** based on customer, category, and product information. Cloud integration facilitates direct upload to Dropbox, while also enabling sellers to email invoices directly to customers.
- Designed the Database structure from scratch to achieve desired requirements.
- Generated **PDF** invoices can directly uploaded to a seller's **Dropbox** account within a specific folder.
- Configured email integration (**SMTP**) to share invoices to customers directly within a single click.
- Integrated **Stripe** payment payment gateway for handling wallet and transactions
- **Technology:** Django, Django REST Framework, PostgreSQL, Swagger, Dropbox API, Twilio, Stripe Payment Gateway JIRA (PMS).
